Program Structures & Algorithms Spring 2022

Assignment No. 04 - Parallel Sorting

Name: Akshay Kumthi Matad

(NUID): 002928833

TASK:

Your task is to implement a parallel sorting algorithm such that each partition of the array is sorted in parallel. You will consider two different schemes for deciding whether to sort in parallel.

- 1. A cutoff (defaults to, say, 1000) which you will update according to the first argument in the command line when running. It's your job to experiment and come up with a good value for this cutoff. If there are fewer elements to sort than the cutoff, then you should use the system sort instead.
- 2. Recursion depth or the number of available threads. Using this determination, you might decide on an ideal number (*t*) of separate threads (stick to powers of 2) and arrange for that number of partitions to be parallelized (by preventing recursion after the depth of *lg t* is reached).
- 3. An appropriate combination of these.

There is a *Main* class and the *ParSort* class in the *sort.par* package of the INFO6205 repository. The *Main* class can be used as is but the *ParSort* class needs to be implemented where you see "TODO..." [it turns out that these TODOs are already implemented].

Unless you have a good reason not to, you should just go along with the Java8-style future implementations provided for you in the class repository.

You must prepare a report that shows the results of your experiments and draws a conclusion (or more) about the efficacy of this method of parallelizing sort. Your experiments should involve sorting arrays of sufficient size for the parallel sort to make a difference. You should run with many different array sizes (they must be sufficiently large to make parallel sorting worthwhile, obviously) and different cutoff schemes.

OUTPUT SCREENSHOTS:

1) Changed ParSort.java to handle thread counts

Cutoff vs time

Conclusions:

- 1. The performance of parallel sort is best when the cutoff is between 20% 50% of the array size and thread count is between 2^3 and 2^5.
- 2. As the thread count increases the time taken reduces. For 1 thread the time taken is more than time taken for 2 and 4 threads.
- 3. For Thread count after 4, the performance remains almost the same.
- 4. The performance degrades and remains constant for thread counts(8-32) when the cutoff is above 50% of the array size.
